#### **EXECUTIVE SUMMARY**

This Report describes sample collection activities conducted at three Northeast Cape sites on St. Lawrence Island, Alaska, which were performed in order to facilitate the first five-year review. Although the five-year review site inspections coincided with the September sample collection, those activities will be described in a separate report.

Sampling activities occurred on 11 and 12 September 2013 at approved locations, as identified in the *Supplement to the Northeast Cape HTRW Remedial Actions Quality Assurance Project Plan* (U. S. Army Corps of Engineers [USACE] 2013b). A summary of the collection activities are listed below:

- At Cargo Beach Road Landfill (Site 7), surface water was collected from three locations and submitted to an offsite analytical laboratory for analysis. Groundwater grab sampling was attempted at four locations downgradient of the landfill. Drive point refusal was encountered at depths ranging from 6 to 30 inches below ground surface, due to large rocks. Groundwater was not encountered during the attempts and sampling was discontinued following consultation with USACE.
- At Housing and Operations Landfill (Site 9), surface water was collected from three locations and submitted to an offsite analytical laboratory for analysis. A single groundwater grab sample was collected from Site 9. Limited water production of 2.5 milliliters (mL) per minute from the drive point screened interval was less than the work plan-specified rate of 250 mL per minute. Sufficient volume was obtained for gasoline-range organics (GRO); benzene, toluene, ethylbenzene, and xylenes (BTEX); and dissolved (field filtered) Resource Conservation and Recovery Act (RCRA) metals with zinc analysis. Groundwater collection was halted following consultation with USACE.
- At Kangukhsam Mountain Spring, surface water was collected from one location and submitted to an offsite analytical laboratory for analysis.

All sample results were compared to the project cleanup level and no exceedances were identified.

(intentionally blank)

#### **1.0 INTRODUCTION**

The Northeast Cape site is located on St. Lawrence Island, Alaska approximately 135 air miles southwest of Nome (Figure A-1). The Village of Savoonga is the closest community, and is located 60 miles northwest of the site (Figure A-2). The Northeast Cape site was constructed as an Aircraft Control and Warning Station during 1950 and 1951, and provided radar coverage and surveillance as part of the Alaska Early Warning System until 1972. The site encompasses approximately 4,800 acres (7.5 square miles) and is bounded by Kitnagak Bay to the northeast, Kangighsak Point to the northwest, and the Kinipaghulghat Mountains to the south. The Northeast Cape site, classified as a Formerly Used Defense Site (FUDS), is comprised of 34 individual sites. These individual sites have previously been subject to several phased remedial investigations and/or removal actions.

Site-specific sampling was requested by community members at the two landfill sites and the seasonal drinking water source, Kangukhsam Mountain Spring (Figure A-3). Sampling activities coincided with five-year review site inspections.

#### **1.1 OBJECTIVES**

The purpose of this sampling effort is to determine if site-specific contaminants of concern (COC) are present in groundwater and/or surface water at the Cargo Beach Road Landfill (Site 7), the Housing and Operations Landfill (Site 9), or Kangukhsam Mountain Spring.

#### **1.2 SCOPE OF WORK**

The definable features of work include the following:

- Collection of one surface water sample from Kangukhsam Mountain Spring
- Collection of one surface water sample from three locations within Cargo Beach Road Landfill (Site 7)
- Attempt collection of one groundwater grab sample from Cargo Beach Road Landfill (Site 7)
- Collection of one surface water sample from three locations within Housing and Operations Landfill (Site 9)

- Collection of one groundwater grab sample from Housing and Operations Landfill (Site 9)
- Management of investigation-derived waste

# **1.3 FIELD CHANGE FORMS**

Work described in this report was conducted in accordance with the *Supplement to the Northeast Cape HTRW Remedial Actions Quality Assurance Project Plan* (USACE 2013b). Deviations from the Work Plan and/or approved field changes were not generated from this sampling effort.

#### 2.0 FIELD INVESTIGATION ACTIVITIES

Surface water and/or groundwater samples were collected from three Northeast Cape sites between 11 September 2013 and 12 September 2013. Jacobs personnel travelled from Anchorage to Nome via commercial airline, and from Nome to the Northeast Cape site via charter aircraft. While onsite, personnel were housed within a temporary camp maintained by Bristol Environmental Remediation Services, LLC (BERS). Throughout the duration of the sampling activities, BERS was onsite completing work described in the *Northeast Cape HTRW Remedial Actions Work Plan, Revision 1* (USACE 2013a). Ambient temperatures ranged from 35 to 40 degrees Fahrenheit (°F) during the sampling effort.

#### 2.1 SAMPLING AND ANALYTICAL APPROACH

Individual sites within the Northeast Cape site were accessed via existing site roads. Sampling locations were identified using existing landmarks and verified with the onsite USACE Quality Assurance Representative prior to sampling.

Sampling at the Northeast Cape site included the collection of both unfiltered and filtered water samples. Unfiltered water samples were used for analysis of gasoline-range organics (GRO) by Alaska Method 101 (AK101), diesel-range organics (DRO) by AK102, residual-range organics (RRO) by AK103, benzene, toluene, ethylbenzene, and xylenes (BTEX) by U.S. Environmental Protection Agency (EPA) Method SW8260C, polycyclic aromatic hydrocarbons (PAH) by EPA Method SW8270-SIM, polychlorinated biphenyls (PCB) by EPA Method SW8082, eight Resources Conservation and Recovery Act (RCRA) metals, and zinc by EPA Method SW6020A/SW7471. Filtered water samples were collected for analysis of dissolved metals, which was performed using a disposable 0.45-micron (µm) in-line water filter attached to a peristaltic pump. Filtered water was transferred to sample containers provided by the laboratory and used for analysis of eight RCRA metals and zinc by EPA Method SW6020A/SW7471. In addition, filtered and unfiltered water samples collected from Cargo Beach Road Landfill (Site 7) were also analyzed for nickel using EPA Method SW6020A.

A pin flag or lathe was placed at the sampling location to allow for later identification during surveying. Observations, sampling information, and field parameter readings were recorded in the field logbook and/or field sampling forms provided in Appendix C. Photographs relevant to this sampling effort are included in the photograph log (Appendix D). The logbook (Appendix C) was shared between two field teams during this field effort and includes additional photographs and field activities not related to site-specific sampling efforts.

#### 2.2 SURFACE WATER SAMPLING

Surface water samples were collected from Cargo Beach Road Landfill (Site 7), Housing and Operations Landfill (Site 9), and Kangukhsam Mountain Spring. Samples were collected near the shoreline, slightly below the surface of the water. A disposable Teflon<sup>®</sup> dipper was used to retrieve the surface water at each location in accordance with the procedures detailed in the *Supplement to the Northeast Cape HTRW Remedial Actions Quality Assurance Project Plan* (USACE 2013b). Sampling locations are shown in Figures A-4, A-5, and A-6.

#### 2.3 GROUNDWATER GRAB SAMPLING

Groundwater grab sampling was attempted downgradient of Cargo Beach Road Landfill (Site 7) and Housing and Operations Landfill (Site 9). A 30-inch screened drive point was attached to a 36-inch drive rod (totaling 66 inches in length) and advanced into the subsurface using hand tools until groundwater was encountered or refusal was met.

At Cargo Beach Road Landfill (Site 7), large rocks were visible at the surface near the proposed groundwater grab sample location north of the landfill cap. The first attempt to advance the drive point resulted in a ground penetration of 6 inches before refusal was met. The onsite USACE Quality Assurance Representative was consulted along with the USACE Project Manager and a decision was made to step out from the planned groundwater grab sampling location. The drive point was advanced at three additional locations and met with refusal each time. The greatest depth reached during these attempts was 30 inches below ground surface (bgs) and recoverable water was not observed; therefore, groundwater grab

sampling was halted. Figure A-4 displays the attempted groundwater grab sample locations at Cargo Beach Road Landfill (Site 7).

At Housing and Operations Landfill (Site 9), the terrain near the groundwater grab sample location appeared to be tundra with little exposed rock. The drive point was advanced and achieved a ground penetration of 48 inches before resistance – possibly due to permafrost – was noticed. Water was found in the drive point and eventually stabilized at 33 inches bgs as measured by a water level probe.

An unused <sup>1</sup>/<sub>4</sub>-inch inside diameter polyethylene tube was inserted through the drive rod (until it was below the water surface) and attached to a peristaltic pump. The pump was set to the lowest speed and water was removed from the drive point into a graduated beaker to determine the flow. The flow rate was found to be 2.5 mL per minute, which is far below the minimum acceptable flow rate of 250 mL per minute, as established in the work plan. Although groundwater production from the well point was low, sufficient volume was collected over a two-hour period for field parameter measurements and to fill sample containers for BTEX, GRO, and dissolved (field filtered) RCRA metals with zinc analysis. The onsite USACE Quality Assurance Representative was consulted along with the USACE Project Manager regarding the limited water production, and groundwater sampling was discontinued. Figure A-5 displays the Housing and Operations Landfill (Site 9) groundwater grab sample location.

### 2.4 LAND SURVEYING

An optical survey was performed in order to record the sampling and attempted sampling locations. Surveying was conducted by Eco-Land, LLC, a professional land surveyor, subcontracted by BERS. Horizontal data are presented in feet, using the Alaska State Plane Zone 9 projection and the North American Datum of 1983. Survey data tables relevant to sampling locations, and compliant with the *Manual for Electronic Deliverables* (USACE 2011), will be included with the Remedial Actions Report prepared by BERS. An abbreviated survey data table is included in Appendix F.

#### 2.5 WASTE MANAGEMENT

Waste was transported and disposed of in accordance with all applicable local, state, and federal regulations. Investigation-derived waste included used personal protective equipment, disposable filters and bailers, calibration and decontamination water, and general refuse. Solid waste was stored in a contractor bag, co-mingled with BERS waste onsite, and disposed of by BERS in accordance with the *Northeast Cape HTRW Remedial Actions Work Plan, Revision 1* (USACE 2013a). Liquid waste was stored in a 5-gallon bucket and transported to Anchorage, Alaska by Jacobs personnel, then transferred to Emerald Waste Services in Palmer, Alaska for disposal. Liquid waste quantities are summarized in Table 2-1; the liquid waste manifest and certificate of disposal are included in Appendix E.

Table 2-1Liquid Waste Quantities

| Waste Type                  | Number of Containers | Disposal Quantity |
|-----------------------------|----------------------|-------------------|
| Non-hazardous<br>Wastewater | 1                    | 5-gallon bucket   |

#### 3.0 INVESTIGATION RESULTS

This section summarizes the field and analytical results for the 2013 sampling activities, which were conducted at the Northeast Cape site by Jacobs. The sample summary table, complete analytical results, and assessment of data quality are included in Appendix B.

#### 3.1 SURFACE WATER SAMPLING RESULTS

Prior to sampling, field parameters were recorded directly from the water source using a YSI water quality meter and a Micro turbidimeter. Surface water parameters measured prior to sampling are provided in Table 3-1.

| Site ID | Sampling<br>Location              | Temperature<br>(°C) | Conductivity<br>(µS/cm) | DO<br>(mg/L) | рН   | ORP<br>(mV) | Turbidity<br>(NTU) |

 Table 3-1

 Surface Water Parameters Prior to Sampling

#### Notes:

<sup>1</sup>Sampling locations 9LF-WS01 and 9LF-WS02 are a duplicate pair

°C = Degrees Celsius

DO = dissolved oxygen

KMS = Kangukhsam Mountain Spring  $\mu$ S/cm = microSiemens per centimeter

 $\mu$ S/cm = microSiemens per centil mg/L = milligrams per liter

mV = millivolts

NTU = nephelometric turbidity units

ORP = oxidation reduction potential

Turbidity readings for sampling locations 7LF-WS01 and 9LF-WS04 were found to be much greater than other nearby sampling locations. Sampling locations 7LF-WS01 and 9LF-WS04 are located immediately adjacent to the landfill caps for each site and were noted as being turbid with no apparent odor or sheen. Field observations by Jacobs personnel did not identify

any recent disturbances or possible landfill cap erosion that could have contributed to the high turbidity readings.

Seven primary surface water samples and one duplicate sample were collected and sent to ALS Environmental, Inc. (ALS) for analysis. Analytical results were compared to project cleanup levels obtained from Table 15-3 of the *Northeast Cape HTRW Remedial Actions Work Plan, Revision 1* (USACE 2013a), using the cleanup levels from the "Cleanup levels from 2009 Decision Document" column (USACE 2009). Surface water analytical results are presented in the following subsections.

## Cargo Beach Road Landfill (Site 7)

Three primary surface water samples were collected for analysis of GRO, DRO, RRO, BTEX, PAHs, PCBs, eight RCRA metals, nickel, and zinc. Sampling locations are shown in Figure A-4.

Analytes did not exceed project cleanup levels in surface water samples collected from this site. The complete analytical results table is provided in Appendix B.

# Housing and Operations Landfill (Site 9)

Three primary surface water samples and one duplicate sample were collected for analysis of GRO, DRO, RRO, BTEX, PAHs, PCBs, eight RCRA metals and zinc. Sampling locations are shown in Figure A-5.

Analytes did not exceed project cleanup levels in surface water samples collected from this site. The complete analytical results table is provided in Appendix B.

# Kangukhsam Mountain Spring

One surface water sample was collected and analyzed for GRO, DRO, RRO, BTEX, PAHs, PCBs, eight RCRA metals, and zinc. This sampling location is shown in Figure A-6.

Analytes did not exceed project cleanup levels in surface water samples collected from this site. The complete analytical results table is provided in Appendix B.

#### 3.2 GROUNDWATER GRAB SAMPLING RESULTS

Groundwater grab sampling was attempted at locations downgradient from Cargo Beach Road Landfill (Site 7) and Housing and Operations Landfill (Site 9). Due to the limitations described in Section 2.3, only one primary groundwater grab sample was collected from Housing and Operations Landfill (Site 9); it was sent to ALS for analysis. Analytical results were compared to the project cleanup levels obtained from Table 15-3 of the *Northeast Cape HTRW Remedial Actions Work Plan, Revision 1* (USACE 2013a), using the cleanup levels from the "Cleanup levels from 2009 Decision Document" column (USACE 2009).

Prior to sampling, field parameters including: temperature, pH, dissolved oxygen, conductivity, oxidation-reduction potential, and turbidity, were recorded using a YSI water quality meter and a Micro turbidimeter. Groundwater parameters measured at the time of sampling are provided in Table 3-2.

Table 3-2 Groundwater Parameters Prior to Sampling

| Site ID | Sampling<br>Location | Temperature<br>(°C) | Conductivity<br>(µS/cm) | DO<br>(mg/L) | рН   | ORP<br>(mV) | Turbidity<br>(NTU) |  |
|---------|----------------------|---------------------|-------------------------|--------------|------|-------------|--------------------|--|
| Site 9  | 9LF-WG01-2           | 6.22                | 132                     | 0.73         | 5.44 | 177         | 9999 <sup>1</sup>  |  |

Notes:

<sup>1</sup> A reading of "9999" indicates an over range error code.
 °C = Degrees Celsius
 DO = dissolved oxygen
 µS/cm = microSiemens per centimeter
 mg/L = milligrams per liter
 mV = millivolts
 NTU = nephelometric turbidity units
 ORP = oxidation reduction potential

# Cargo Beach Road Landfill (Site 7)

Groundwater grab samples were not collected from Cargo Beach Road Landfill (Site 7).

### Housing and Operations Landfill (Site 9)

One primary groundwater grab sample was collected from this site. Sediment and organics in the groundwater continually blocked the flow of groundwater through the screen, resulting in a groundwater production rate of approximately 2.5 milliliters per minute (mL/min). The

groundwater production rate resulted in a limited quantity of groundwater available for analysis. A sufficient volume of groundwater was collected for the analysis of GRO by AK101, BTEX by SW8260C, and dissolved (field filtered) RCRA metals with zinc by SW6020A/SW7471.

Although the analysis of DRO by AK102, RRO by AK103, PAHs by SW8270-SIM, and PCBs by SW8082 were planned, insufficient water production from the well point and the volume of water required to fill the sample containers (six liters) made collection impractical. An unfiltered sample volume for RCRA metals with zinc by SW6020A/SW7471 analysis was not collected due to high turbidity.

GRO, BTEX, and dissolved metals (RCRA metals with zinc) did not exceed project cleanup levels in groundwater obtained from Site 9. The complete analytical results table is provided in Appendix B.

## 3.3 DATA EVALUATION

Data quality was assessed through the review of the laboratory case narrative, laboratory data deliverables, and completion of ADEC checklists. A review of the analytical results and associated QC samples was performed by the Jacobs Project Chemist, as per the *Work Plan* (USAF 2013b).

Data quality was evaluated against the following requirements: U.S. Department of Defense *Quality Systems Manual for Environmental Laboratories*, version 4.2 (U.S. Department of Defense 2010); ADEC and EPA analytical methods (ADEC 2008; EPA 2007); and laboratory limits. Qualifiers were applied to sample results that did not meet the project data quality objectives. Qualified results are considered estimated and, whenever possible, indicated as biased high or low.

The data assessment found the overall quality of the project data to be acceptable and no results were rejected. The complete dataset, in addition to details of the data validation, is provided in the Data Quality Assessment (Appendix B).

#### 4.0 CONCLUSIONS

Surface water and groundwater results collected during the 2013 sampling effort did not detect analytes greater than the project cleanup levels.

#### 4.1 CARGO BEACH ROAD LANDFILL (SITE 7)

This site has been subject to several remedial efforts, including: investigation of metallic anomalies, removal of approximately 50 drums and 50 cubic yards of severely stained soils, placement of a minimum 2-foot thick, gravel landfill cap in 2009, and revegetation.

Previously identified COCs in surface water include DRO, which was detected in one surface water sample at a concentration of 8.9 mg/L in 1994 (USACE 2007). Groundwater grab samples collected in 2001, approximately 200 feet downgradient of the surface water exceedance, did not contain DRO greater than cleanup levels. Alternatively, lead and RRO were detected at concentrations exceeding cleanup levels (USACE 2007).

The 1994 surface water sampling location was not available for resampling in 2013 because the area had previously been covered by the landfill cap in 2009. As an alternative, site surface water was collected from three ponds located near the base of the landfill cap. The locations were selected as a representative subset of site surface water. Surface water sampling locations are shown in Figure A-4. Surface water samples were analyzed for DRO, RRO, GRO, BTEX, PAHs, PCBs, RCRA metals, nickel, and zinc. Analytical results did not exceed project cleanup levels in surface water samples from this site.

The 2013 groundwater grab sampling was attempted near the 2001 groundwater grab sampling locations; however, as described previously in Section 2.3, groundwater grab samples could not be collected because refusal was met at 30 inches bgs and groundwater was not present. Historically, sampling groundwater at this site has been quite difficult. Previous efforts to install temporary well points were successful at location WP 7-1 in 2001, yet required approximately three days before sampling could take place due to a low groundwater production rate. In some cases, the sampling points purged dry after 48 hours, without producing the required sampling volume (USACE 2007). Two groundwater grab samples

(WP7-2 and WP7-3) collected in 2001 were obtained by digging 'pits' to 36 to 40 inches bgs and allowing them to fill with water prior to sampling.

Significant effort will be required to install and maintain permanent monitoring wells at Cargo Beach Road Landfill (Site 7). The use of a tracked drill rig in addition to air rotary or sonic drilling methods would likely be needed for the successful installation of a monitoring well at this location. Walking the needed the drill rig to boring locations would subject the fragile tundra and surface vegetation to disturbance. Additionally, any monitoring wells would likely be subject to frost jacking due the extreme variability of seasonal conditions.

## 4.2 HOUSING AND OPERATIONS LANDFILL (SITE 9)

This site has been subject to several remedial actions, including placement of a minimum 2foot thick, gravel landfill cap in 2010, removal of debris from nearby streams, construction of a diversion trench, and revegetation.

Sampling of groundwater in 2001 identified lead, RRO, beryllium, and antimony above cleanup levels at locations downgradient, to the north, east, and west of the landfill (USACE 2007). Figure A-5 shows historical sampling locations from 2001 that exceed cleanup levels. Groundwater sampling in 2013 was located at a downgradient location east of the landfill cap, and did not detect GRO, BTEX, filtered RCRA metals, or zinc above project cleanup levels. Future sampling efforts at this site may benefit from sampling near the 2001 locations that produced sufficient quantities of groundwater and contained contaminants at levels greater than cleanup levels.

Historical analysis of surface water samples did not detect contaminants greater than cleanup levels (USACE 2009). In 2013, surface water samples were collected from a pond located immediately north of the landfill cap and at the northern and southern extents of the constructed diversion trench, located downgradient and immediately adjacent to the landfill cap. Sampling locations are shown in Figure A-5. Analytical results indicate that contaminants did not exceed project cleanup levels.

### 4.3 KANGUKHSAM MOUNTAIN SPRING

This site was added as a sampling location at the Northeast Cape site after a request from a local community member. The spring is located to the south of the Northeast Cape site, near the Lower Tramway (Site 32), and is used as a seasonal drinking water source. Surface water samples were collected from an area likely to be used for drinking water, upgradient from many of the Northeast Cape sites. Analysis of these samples did not detect contaminants exceeding project cleanup levels.

# **APPENDIX B**

Data Quality Assessment, ADEC Checklists, and Supporting Documentation

#### **1.0 INTRODUCTION**

A Data Quality Assessment and ADEC laboratory data review checklists were completed to assess the overall quality and usability of data from the 2013 NE Cape surface water and groundwater activities. The Jacobs Project Chemist performed a data quality review using the 2013 Supplement to the Northeast Cape HTRW Remedial Actions Work Plan (QAPP 2013).

This DQA, which appears as an appendix to the 2013 Sampling Report, contains analytical data tables, sample summary tables, and Alaska Department of Environmental Conservation (ADEC) Laboratory Data Review Checklists, organized into the following attachments:

- Attachment B-1 contains the sample summary and analytical data tables.
- Attachment B-2 presents tables of sample results that did not meet the project data quality objectives (DQO).
- Attachment B-3 includes the ADEC Laboratory Data Review Checklists for each sample delivery group.
- Attachment B-4 provides laboratory data in electronic format.

Seven primary water samples and one duplicate sample were submitted for gasoline-range organics (GRO); diesel-range organics (DRO); residual-range organics (RRO); polychlorinated biphenyls (PCBs); benzene, toluene, ethylbenzene, and xylene (BTEX); polycyclic aromatic hydrocarbons (PAH); dissolved metals; and total metals analysis. One primary sample was submitted for GRO, BTEX, and dissolved metals; there was insufficient sample volume for further analysis. One trip blank was submitted for GRO and BTEX. ALS Laboratories of Kelso, Washington, provided primary analytical support for these water samples.

#### 2.0 DATA QUALITY SUMMARY

This evaluation consisted of a review of chain-of-custody (CoC) and sample receipt records; laboratory case narratives; and laboratory data, which includes analytical methodology, sample holding times, laboratory blanks, detection limit (DL), limit of detection (LOD), limit of quantitation (LOQ), surrogate recoveries, laboratory control sample (LCS) recoveries, matrix spike (MS) recoveries, and precision. Analytical data quality objectives (DQOs) were considered met when the quality of the sample data met precision, accuracy, representativeness,

completeness, comparability, and sensitivity requirements, as specified in the project Work Plan (QAPP 2013). Results were categorized as acceptable, estimated, or rejected (flagged R). Data was qualified according to the definitions at the bottom of the analytical data table (Attachment B-1). A completeness check of the laboratory data was performed to verify that the data packages and electronic files included all information requested.

The overall quality of the data was acceptable, as qualified with the anomalies below and described in the ADEC laboratory data review checklist.

- AK103 method blank (QC batch KWG1310602) had RRO concentrations above the detection limit. Associated samples that have a concentration within a factor of 10 of the method blank contamination are qualified B and are presented in Table B-2-1 (Attachment B-2). There is no impact on the data since results are biased high and less than the Project Action Limit of 1.1 mg/L.
- AK102/AK103 method blank (QC batch KWG1311318) extract was lost during the initial extraction. Samples were re-extracted within the holding time. During the re-extraction the extraction vial for sample 13-9LF-WS03-0 broke. There was insufficient sample for a third re-extraction. The results from the initial extraction were reported and qualified QN; they are presented in Table B-2-2 (Attachment B-2). The impact is minimal since results were less than the Project Action Limits and there is no bias.
- AK102 MS and MSD recoveries for DRO were less than AK series method criteria at 72% and 74%, respectively. Parent sample 13-9LF-WS01-0 was qualified ML, indicating a low bias due to matrix effects. Impacts are minimal since the DRO result was significantly less than the Project Action Limit. Qualified results are presented in Table B-2-3 (Attachment B-2).
- Field duplicate precision was evaluated by calculating the RPD between the primary sample 13-9LF-WS01-0 and duplicate sample 13-9LF-WS02-0. Multiple analytes had RPDs greater than 30% and were qualified QN. These results are presented in Table B-2-4 (Attachment B-2). The impact is minimal since in all cases the primary and duplicate were less than Project Action Limit.

<sup>1</sup> Project action limit from 2013 QAPP (USACE 2013) and 18 AAC 75, Table C Groundwater Cleanup Levels (ADEC 2012)

- = No criteria/ Not analyzed

ND [LOD] = The analyte result is less than the limit of detection [value in brackets].

mg/L = milligram per liter

J = The analyte result is considered an estimated value because the reported result is below the limit of quantitation but above the detection limit (formerly the method detection limit.

SDG = sample delivery group

CASK = ALS Laboratories formerly known as Columbia Analytical Services of Kelso, WA

<sup>1</sup> Project action limit from 2013 QAPP (USACE 2013) and 18 AAC 75, Table C Groundwater Cleanup Levels (ADEC 2012)

– = No criteria/ Not analyzed

ND [LOD] = The analyte result is less than the limit of detection [value in brackets].

mg/L = milligram per liter

J = The analyte result is considered an estimated value because the reported result is below the limit of quantitation but above the detection limit (formerly the method detection limit.

B = Analyte result is considered a high biased estimated value due to contamination present in the method blank. Results less than 10 times the reported method blank concentration will be B flagged to indicate bias.

QN = Analyte result is considered estimated value biased uncertain due to due to a laboratory quality control failure.

ML = Analyte result is considered an estimated value biased low due to matrix effects.

SDG = sample delivery group

CASK = ALS Laboratories formerly known as Columbia Analytical Services of Kelso, WA

<sup>1</sup> Project action limit from 2013 QAPP (USACE 2013) and 18 AAC 75, Table C Groundwater Cleanup Levels (AD

– = No criteria/ Not analyzed

ND [LOD] = The analyte result is less than the limit of detection [value in brackets].

mg/L = milligram per liter

J = The analyte result is considered an estimated value because the reported result is below the limit of quantitat

B = Analyte result is considered a high biased estimated value due to contamination present in the method blank

QN = Analyte result is considered estimated value biased uncertain due to due to a laboratory quality control failu

ML = Analyte result is considered an estimated value biased low due to matrix effects.

SDG = sample delivery group

CASK = ALS Laboratories formerly known as Columbia Analytical Services of Kelso, WA

<sup>1</sup> Project action limit from 2013 QAPP (USACE 2013) and 18 AAC 75, Table C Groundwater Cleanup Levels (AD

– = No criteria/ Not analyzed

ND [LOD] = The analyte result is less than the limit of detection [value in brackets].

mg/L = milligram per liter

J = The analyte result is considered an estimated value because the reported result is below the limit of quantitat

B = Analyte result is considered a high biased estimated value due to contamination present in the method blank

QN = Analyte result is considered estimated value biased uncertain due to due to a laboratory quality control failu

ML = Analyte result is considered an estimated value biased low due to matrix effects.

SDG = sample delivery group

CASK = ALS Laboratories formerly known as Columbia Analytical Services of Kelso, WA

6.

- b. Laboratory Control Sample/Duplicate (LCS/LCSD)
  - i. Organics One LCS/LCSD reported per matrix, analysis and 20 samples? (LCS/LCSD required per AK methods, LCS required per SW846)

| Ves Yes | 🔲 No | NA (Please explain.) | Comments: |
|---------|------|----------------------|-----------|
|---------|------|----------------------|-----------|

ii. Metals/Inorganics – one LCS and one sample duplicate reported per matrix, analysis and 20 samples?

🗹 Yes 🗖 No 🗖 NA (Please explain.)

Comments:

iii. Accuracy – All percent recoveries (%R) reported and within method or laboratory limits? And project specified DQOs, if applicable. (AK Petroleum methods: AK101 60%-120%, AK102 75%-125%, AK103 60%-120%; all other analyses see the laboratory QC pages)

□ Yes IN NO □ NA (Please explain.) Comments:

All LCS percent recoveries were within DoD QSM and AK series criteria.

AK102 – MS and MSD recovery for DRO was less than ADEC method criteria at 72% and 74%. SW8270 – MS recovery for Benzo(a)pyrene was greater than DoD QSM criteria at 113%.

 iv. Precision – All relative percent differences (RPD) reported and less than method or laboratory limits? And project specified DQOs, if applicable. RPD reported from LCS/LCSD, MS/MSD, and or sample/sample duplicate. (AK Petroleum methods 20%; all other analyses see the laboratory QC pages)

🗹 Yes 🔲 No 🥅 NA (Please explain.)

Comments:

v. If %R or RPD is outside of acceptable limits, what samples are affected?

Comments:

AK102 – Parent sample 13-9LF-WS01-0 was affected SW8270 – Parent sample 13-9LF-WS01-0 was not affected since the bias was high and the parent sample result was nondetect.

vi. Do the affected sample(s) have data flags? If so, are the data flags clearly defined?

🗹 Yes 🗖 No 🧖 NA (Please explain.)

Comments:

AK102 – Parent sample 13-9LF-WS01-0 was qualified ML

SW8270 – Parent sample 13-9LF-WS01-0 was not qualified since the bias was high and the parent sample result was nondetect.

vii. Data quality or usability affected? (Use comment box to explain.)

Comments:

Data quality was minimally affected even though the bias was low; the AK102 sample result 13-9LF-WS01-0 was significantly below the Project Action Limit.

Comments:

iii. Data quality or usability affected? (Please explain.)

Comments:

Data quality and usability were not affected.

### 7. Other Data Flags/Qualifiers (ACOE, AFCEE, Lab-Specific, etc.)

a. Defined and appropriate?

✓ Yes □ No □ NA (Please explain.)

Comments:

Qualifiers are defined in the Data Quality section of the report.

## **APPENDIX G**

**Response to comments** 

#### Alaska Department of Environmental Conservation (ADEC) Contaminated Sites Program **Document Reviewed:** Draft November 2013 Northeast Cape Five-year Review Supplemental Site Investigation Report **Commenter:** Curtis Dunkin-ADEC **Date Submitted:** December 18, 2013

| #  | Page # | Section              | ADEC Comment  | Response  |
|----|--------|----------------------|---|---|
| 1. |        | Document<br>Title    | The title of the document should be revised to clarify that this field effort<br>was specifically associated with the first Five-year Review of sites 7 and<br>9. Note the work plan was titled 'Supplement to the NEC HTRW<br>Remedial Actions Work Plan'.   | Accepted<br>The report title will be changed to the<br>following:<br>"2013 SAMPLING CONDUCTED IN<br>CONJUNCTION WITH THE 2013 FIVE<br>YEAR REVIEW AT NORTHEAST<br>CAPE" |
| 2. | ES-1   | Executive<br>Summary | Revise the second sentence by omitting the latter half beginning with<br>'associated' as this part of the sentence doesn't make sense (it is assumed<br>that samples were collected 'where sampling occurred'). Also state here<br>that only one of 5 attempts to collect groundwater samples was<br>successful at sites 7 and 9 due to refusal. Also state wherever applicable<br>throughout the document what the cause of refusal was (i.e. rock,<br>bedrock, permafrost, etc.). Note that the work plan stated that refusal<br>due to permafrost was expected at two feet bgs.<br>Please briefly state in the executive summary and elsewhere in the<br>document where applicable (objectives, etc.) that the field team also<br>conducted site inspections of all sites being evaluated as part of the first<br>Five-year Review. ADEC realizes that the results and observations of<br>these inspections will be provided in the draft Five-year review report<br>and that the subject report is intended to detail the sampling efforts and<br>results. However all efforts conducted as a part of the mobilization<br>associated with this sampling event and/or the Five-year review should<br>be stated in this report. | Accepted<br>The text of the Executive Summary was<br>updated for clarity.   |

| 3. | 1-2 | 1.2 | Second paragraph of this section (and elsewhere throughout the document) please replace 'Record of Decision' with 'Decision Document'.   | Accepted<br>All references to "Record of Decision" will<br>be updated to "Decision Document."   |
|----|-----|-----|--|---|
|    |     |     | Revise the third sentence of the second paragraph of this section to<br>clarify that the site-specific sampling conducted at sites 7 and 9 in 2013<br>was not part of the DD, rather determined in 2013 to be necessary to<br>facilitate the 5-year Review Report.   | Noted.<br>The text of the second paragraph of Section<br>1.0 has been updated as follows:<br>"Site-specific sampling was requested by<br>community members at the two landfill sites<br>and the seasonal drinking water source<br>Kangukhsam Mountain Spring (Figure A-<br>3). Sampling activities coincided with five-<br>year review site inspections." |
| 4. | 1-2 | 1.3 | Add a sentence in the beginning of this section to clarify that in respect<br>to groundwater, one of the objectives was to determine if groundwater<br>was present within the targeted sampling zone at the time of the<br>investigation.  | The QAPP supplement used to complete the fieldwork does not define establishing the presence or absence of groundwater in the targeted sampling zone an objective.  |
| 5. | 3-4 | 3.2 | Site 9: Please explain how it was determined as stated in the second<br>sentence of the first paragraph that 'groundwater was encountered at 2.8<br>feet bgs' when this well only produced 2.5 mL/min.<br>The second paragraph should be revised and should further explain the<br>issue why the analyses were not conducted due to the stated low<br>groundwater production rate. Did this well point experience refusal at<br>2.8 feet bgs?<br>Please revise the last sentence of this subsection to clarify that only the | The text of section 2.3 will be updated to<br>provide additional details regarding Cargo<br>Beach Road Landfill (Site 7)<br>Text regarding Cargo Beach Road Landfill<br>(Site 7) will be deleted from the results<br>Section 3.2  |
| 6  | A 1 | 4.0 | analytes which were analyzed did not exceed cleanup levels.  | Noted The Fire Very Devices and (11)  |
| 6. | 4-1 | 4.0 | Per the comments in # 5 above, the conclusions section should briefly<br>elaborate on the potential data gaps which potentially exist as a result of<br>1) all well points except for one hitting refusal given that groundwater<br>was encountered within the targeted sampling depth for the one well; and   | Noted. The Five Year Review report will<br>elaborate on any potential data gaps<br>identified from the comprehensive review<br>of site information. The Sampling Data<br>Report only represents a single event and as   |

Page 2 of 3

February 12, 2014

|     |     |                             | 2) the hydrogeological dynamic associated with and specific to each of the site 7 and 9 landfills not being well characterized/understood.   | such those conclusions are not appropriate for this report.  |
|-----|-----|-----------------------------|--|--|
| 7.  |     | Figure A-2                  | The site location of NEC is incorrectly depicted (too far east/northeast).   | Accepted. Figure A-2 has been updated.   |
| 8.  |     | Figure A-3                  | Please state Site 7 and 9 within the respective call out box for each site.<br>Please add 'boundary' to the reference of landfill in the legend.   | Accepted. Figure A-3 has been updated.   |
| 9.  |     | Figures<br>A-3 and<br>A-4   | The previous surface and groundwater sampling locations which have<br>been discussed in both this report and its associated ADEC-approved<br>final work plan should be depicted in these figures.<br>Please apply revision requests stated in comment # 8 above to these<br>figures. | Accepted. Historical sampling locations<br>referenced in this report have been added to<br>the appropriate figures.  |
| 10. | B1  | 1.0                         | Please explain why the field team didn't or couldn't collect enough sample volume to run all of the planned analysis of analytes.  | Accepted. The narrative regarding limited groundwater and why planned samples were not collected is now present in Sections 2.3.   |
| 11. | 1-6 | Analytical<br>Data<br>Table | Surface Water: The narrative of the data quality assessment should<br>explain why so many of the analytes in many of the samples are depicted<br>as 'no criteria/not analyzed'.  | Noted. The surface water samples with<br>analytes depicted as 'no criteria/not<br>analyzed' correlate with the column<br>adjacent. The samples were analyzed for<br>dissolved metals and total metals; in order<br>to distinguish between the two an "F" was<br>added to the lab sample ID for dissolved<br>metals analysis. The USACE MED requires<br>lab sample ID to be present in the header<br>information; therefore, the analysis for the<br>sample was split in two columns. |
| 12. | 1   | Analytical<br>Data<br>Table | Groundwater: Why are man of analytes/COCs not listed in this table?  | Noted. See response to comment 11 as it also applies to groundwater.   |
| 13. |     |                             | End of ADEC Comments   |  |
